Maximum Marks	4 Marks

1. Empathize & Discover – Empathy Map Canvas

Source template: The empathy map is intended to capture a user's behaviours, attitudes, goals and challenges from the user's perspective. The completed content below applies that structure to the Auto Ticket Booking System.

SAYS	• "I want to book my ticket quickly." • "I need to know whether seats are available." • "I want the booking details immediately after payment."
THINKS	• I do not want to wait in long queues. • I need accurate availability information. • The booking process should be simple and reliable. • I want confidence that my seat and passenger details are correct.
DOES	• Searches for available buses/trains. • Checks ticket and seat availability. • Selects a seat and enters passenger details. • Makes payment and checks the booking confirmation. • May cancel a ticket or view booking history.
FEELS	• Frustrated by manual queues and delays. • Concerned when availability is unclear. • More comfortable when the process is quick and transparent. • Relieved after receiving a confirmed digital ticket.
PAINS & GAINS	PAINS: Long queues, manual effort, delays, difficulty checking availability, difficulty comparing services, and slow booking. GAINS: Fast search, real-time/clear availability, easy seat selection, digital booking, automatic ticket generation, confirmation, payment, cancellation and booking history.

2. Define the Problem Statements

The original template uses the customer viewpoint structure: “I am… I’m trying to… But… Because… Which makes me feel…”. The following statements are completed for the Auto Ticket Booking System.

Problem Statement	I am (Customer)	I’m trying to	But	Because	Which makes me feel
PS-1	a passenger who needs to travel	find an available service, choose a seat and book a ticket quickly	manual booking can involve queues, delays and difficulty checking availability	the booking information and process may require manual effort	frustrated and delayed when I cannot complete the booking efficiently.
PS-2	a passenger who wants a convenient digital booking experience	enter passenger details, make payment and receive my ticket digitally	I may have to depend on separate/manual steps for booking, confirmation and ticket generation	there is no single automated flow covering the complete booking process	uncertain until I receive clear confirmation and the ticket.

3. Brainstorm & Idea Prioritization

The source project document identifies the problem, proposed solution, brainstormed ideas, grouping, priority and final selected concept. The completed project information is organized below.

Step 1 – Team Gathering, Collaboration and Select the Problem Statement

Problem Statement:

Manual ticket booking can be time-consuming and may involve long queues, delays, and difficulty in checking ticket availability. Users may also find it difficult to compare available services and complete the booking process quickly. The Auto Ticket Booking System aims to provide a simple digital platform where users can search for available services, check ticket availability, select seats, enter passenger details, and book tickets efficiently.

Proposed Solution:

Develop an automated ticket booking system that reduces manual effort and provides a convenient process for searching, selecting, booking and receiving tickets digitally.

Step 2 – Brainstorm, Idea Listing and Grouping

No.	Brainstorming Idea	Idea Grouping
1	User Registration and Login	User Management
2	Search available buses/trains	Search
3	Check ticket availability	Booking
4	Select seat	Seat Management
5	Enter passenger details	Passenger
6	Online ticket booking	Booking
7	Automatic ticket generation	Ticket
8	Booking confirmation	Notification
9	Cancel booked ticket	Cancellation
10	View booking history	User Management
11	Payment option	Payment
12	Admin can add/update routes	Admin
13	Admin can manage ticket availability	Admin
14	Generate booking report	Reports

Main Idea

A user-friendly automated system that allows passengers to search, select, book and receive tickets digitally without depending on manual ticket booking.

Step 3 – Idea Prioritization

Priority	Idea	Importance
1	User Login / Registration	High
2	Search and Availability	High
3	Seat Selection	High
4	Ticket Booking	High
5	Automatic Ticket Generation	High
6	Booking Confirmation	High
7	Payment	High
8	Cancellation	Medium
9	Booking History	Medium
10	Admin Management	High
11	Reports	Medium

Final Selected Concept

The Auto Ticket Booking System will automate the complete ticket booking process, including user login, searching, availability checking, seat selection, passenger details, booking, confirmation and automatic ticket generation.

4. Consolidated Project Requirements

- User registration and login.
- Search available buses/trains.
- Check ticket availability.
- Select a seat.
- Enter passenger details.
- Book tickets online.
- Generate tickets automatically.
- Send booking confirmation.
- Support ticket cancellation.
- Display booking history.
- Provide a payment option.
- Allow administrators to add/update routes.
- Allow administrators to manage ticket availability.
- Generate booking reports.

5. Expected User Flow

Login / Registration → Search Service → Check Availability → Select Seat → Enter Passenger Details → Payment → Confirm Booking → Automatic Ticket Generation → Booking History / Cancellation (if required)

6. Team Completion Fields

Team ID	_____

Date	29 September 2026

Source Notes

This document consolidates the three uploaded templates. The Auto Ticket Booking System content, problem statement, brainstorm ideas, grouping, prioritization and final concept are taken from the uploaded project document. The Empathy Map and Customer Problem Statement sections are completed by applying the structures in the uploaded templates to that same project concept; these completed user-perspective statements are project draft content rather than text explicitly present in the source templates.
