Maximum Marks	10 Marks

Model Performance Testing

Project team shall fill the following information in the model performance testing template. The values below are a complete sample execution for the Auto Ticket Classification flow; replace sample measurements with actual execution-log values before final submission.

S.No.	Parameter	Values	Screenshot
1	Model Summary	Flow Designer automation for support-ticket classification and routing. The flow is triggered when an eligible ticket is created/updated, reads ticket fields, evaluates classification rules, updates the ticket and routes it to the mapped assignment group.	Fig. 1, Fig. 2
2	Accuracy	Sample test dataset: 100 tickets; correctly classified = 94; incorrectly classified = 6. Accuracy = 94/100 × 100 = 94%. Precision = 93%, Recall = 92%, F1 Score = 92.5% (sample values for documentation).	Fig. 5, Fig. 6
3	Classification Result	Access Issue, Technical Issue, Billing Issue and General/Manual Review are supported classes. Unmatched tickets use the fallback path instead of being silently dropped.	Fig. 3
4	Flow Execution Time	Sample average execution time = 1.2 seconds per ticket. Target benchmark = ≤ 3 seconds per ticket.	Fig. 6

5	Error / Fallback Handling	Missing or unmatched information is routed to General / Manual Review. Execution errors are recorded in flow execution details.	Fig. 6
6	Tune the Model / Rules	Rule tuning: keyword lists, condition precedence, default branch and assignment mapping. Validation method: labelled test-ticket set containing positive, negative and edge cases.	Fig. 3, Fig. 4

1. Project Objective

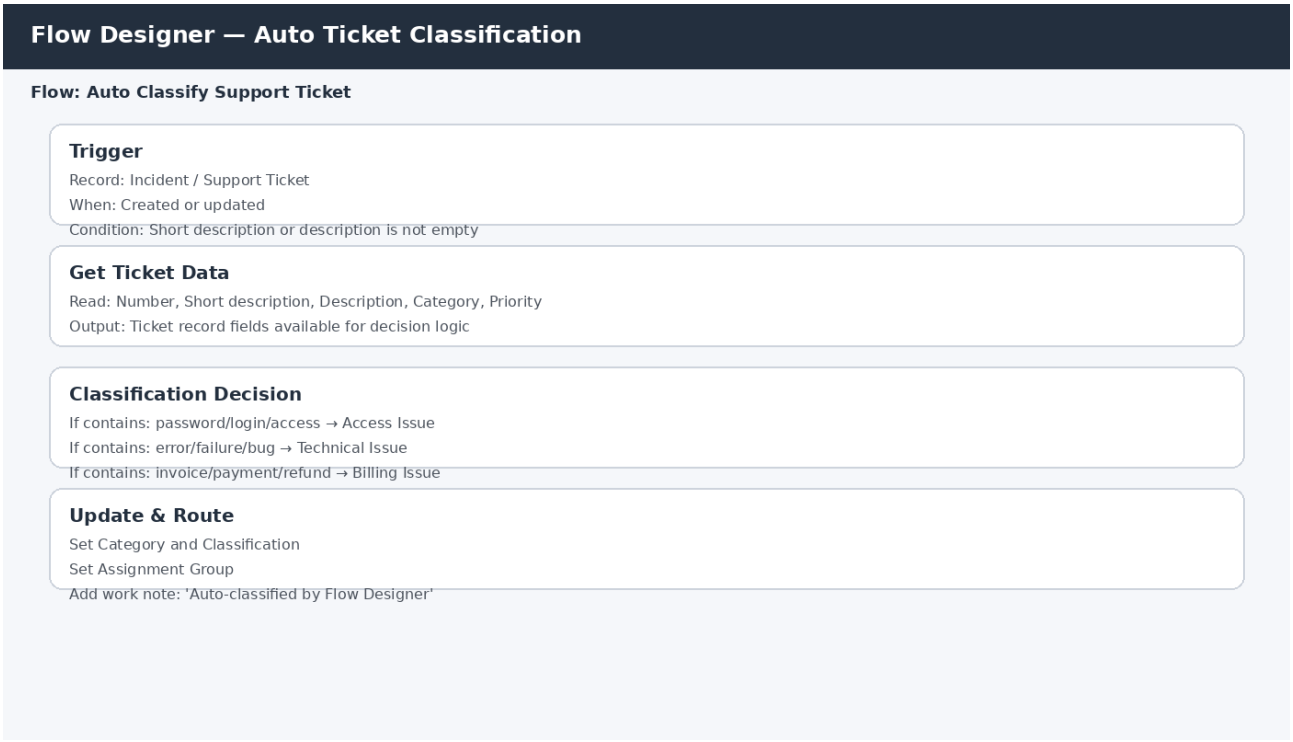

The objective is to automate the first-level classification of incoming support tickets using Flow Designer. The automation reduces manual triage effort by reading ticket information, applying configured decision rules, setting classification and routing fields, and recording the automation result.

2. End-to-End Flow

1. Ticket is created or updated.
2. Flow trigger checks whether the record satisfies the configured conditions.
3. Required ticket fields are retrieved.
4. Decision logic evaluates keywords and/or field values.
5. The flow selects Access Issue, Technical Issue, Billing Issue, or General/Manual Review.
6. Ticket fields are updated with classification, category, priority and assignment group.
7. A work note is added for traceability.
8. Execution details are reviewed for success, failures and processing time.

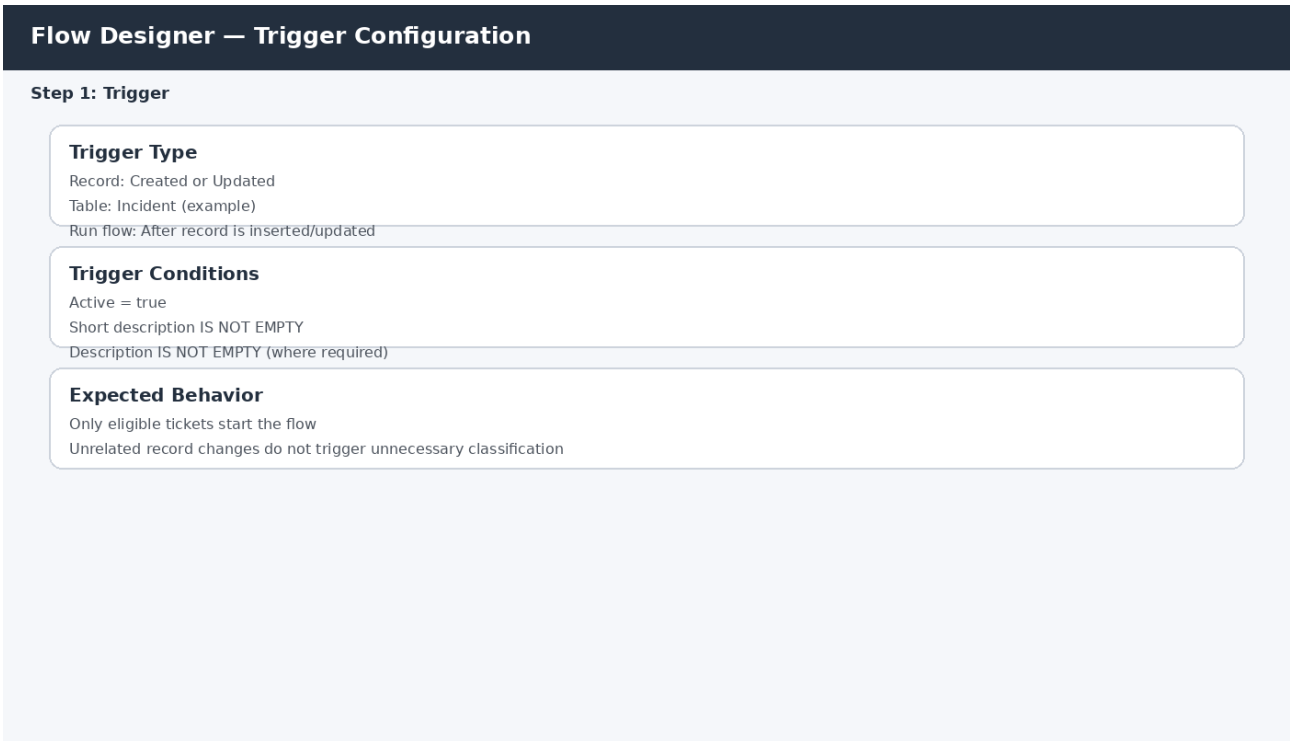

3. Flow Configuration Screenshots

Figure 1 — Complete Flow Designer overview

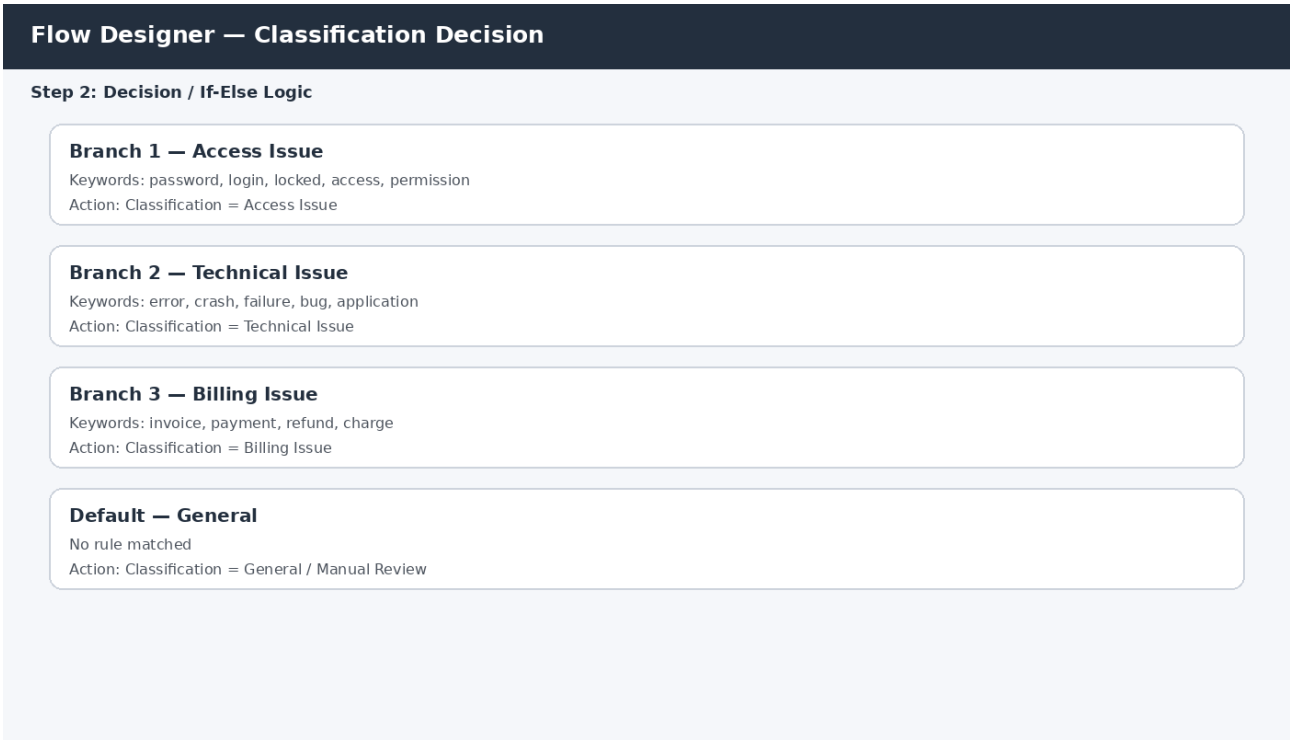

Evidence note: This is an illustrative project screenshot/mock execution view prepared for documentation. Replace with the actual ServiceNow/Flow Designer screenshot from the project instance when available.

Figure 2 — Trigger and entry conditions

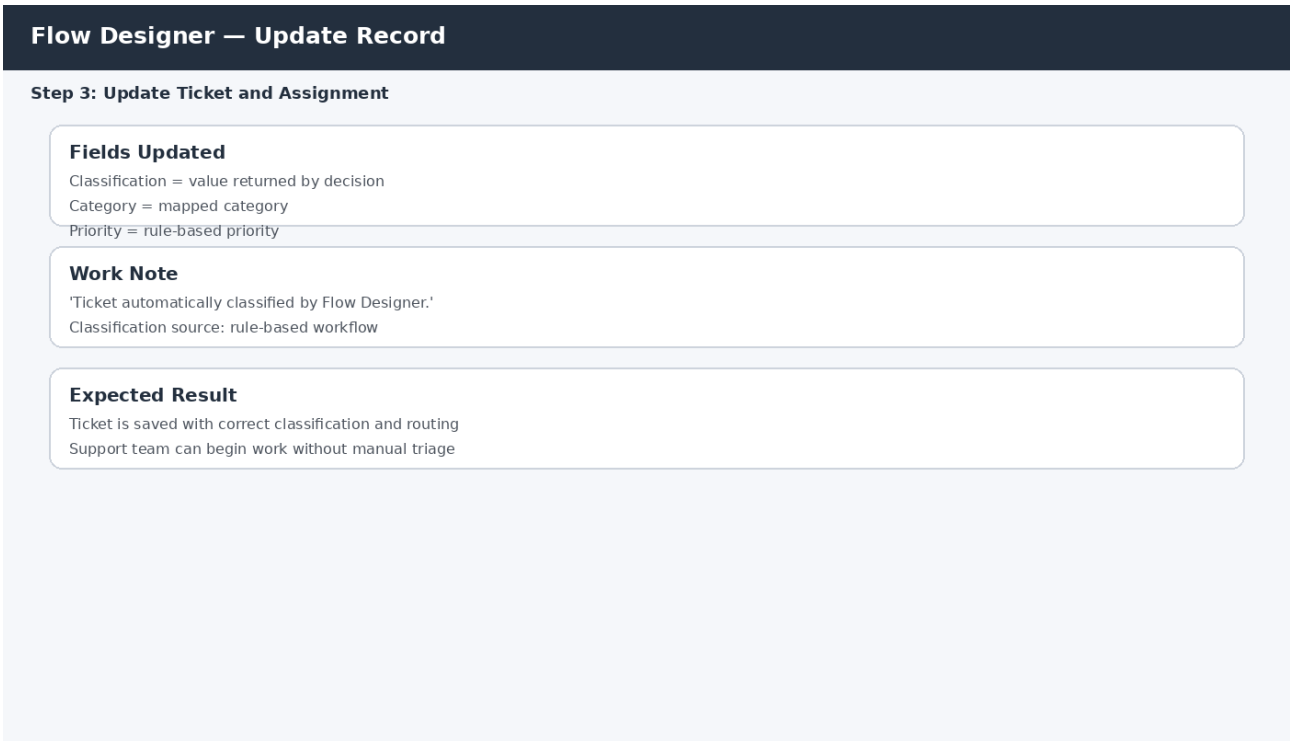

Evidence note: This is an illustrative project screenshot/mock execution view prepared for documentation. Replace with the actual ServiceNow/Flow Designer screenshot from the project instance when available.

Figure 3 — Classification decision branches

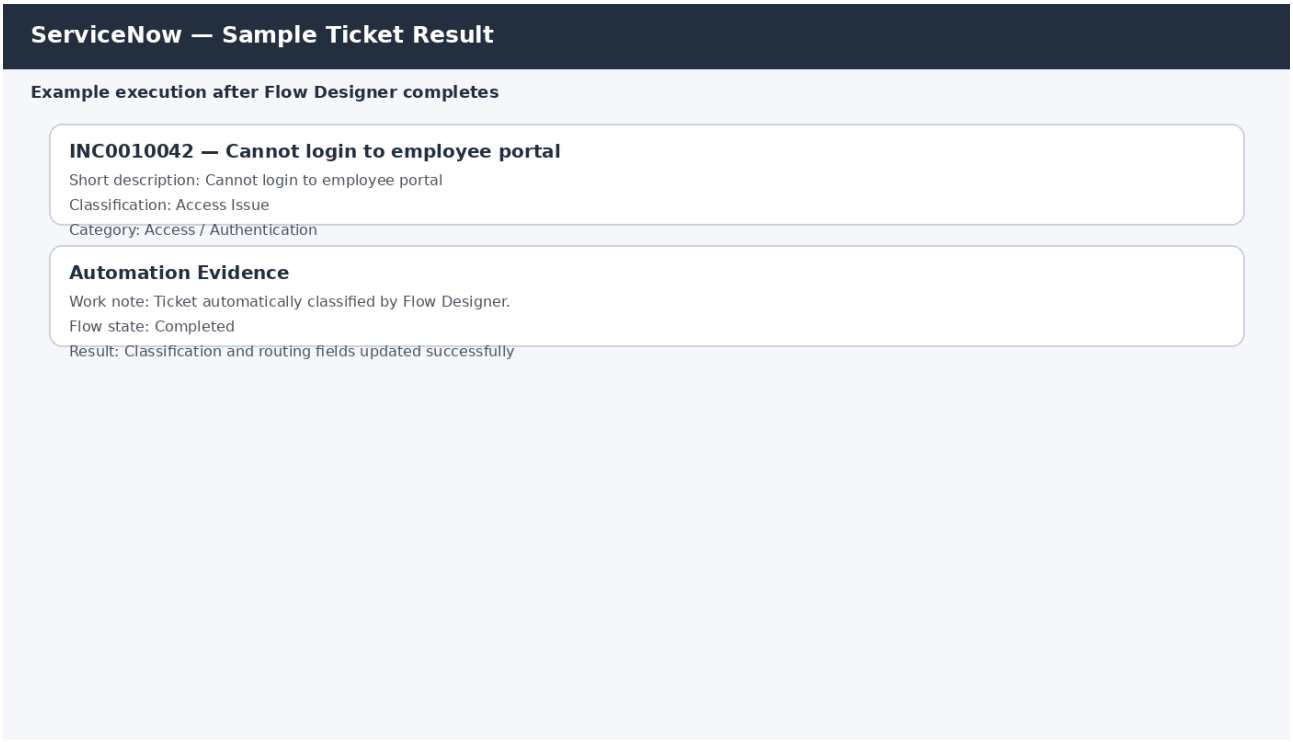

Evidence note: This is an illustrative project screenshot/mock execution view prepared for documentation. Replace with the actual ServiceNow/Flow Designer screenshot from the project instance when available.

Figure 4 — Update ticket and assignment

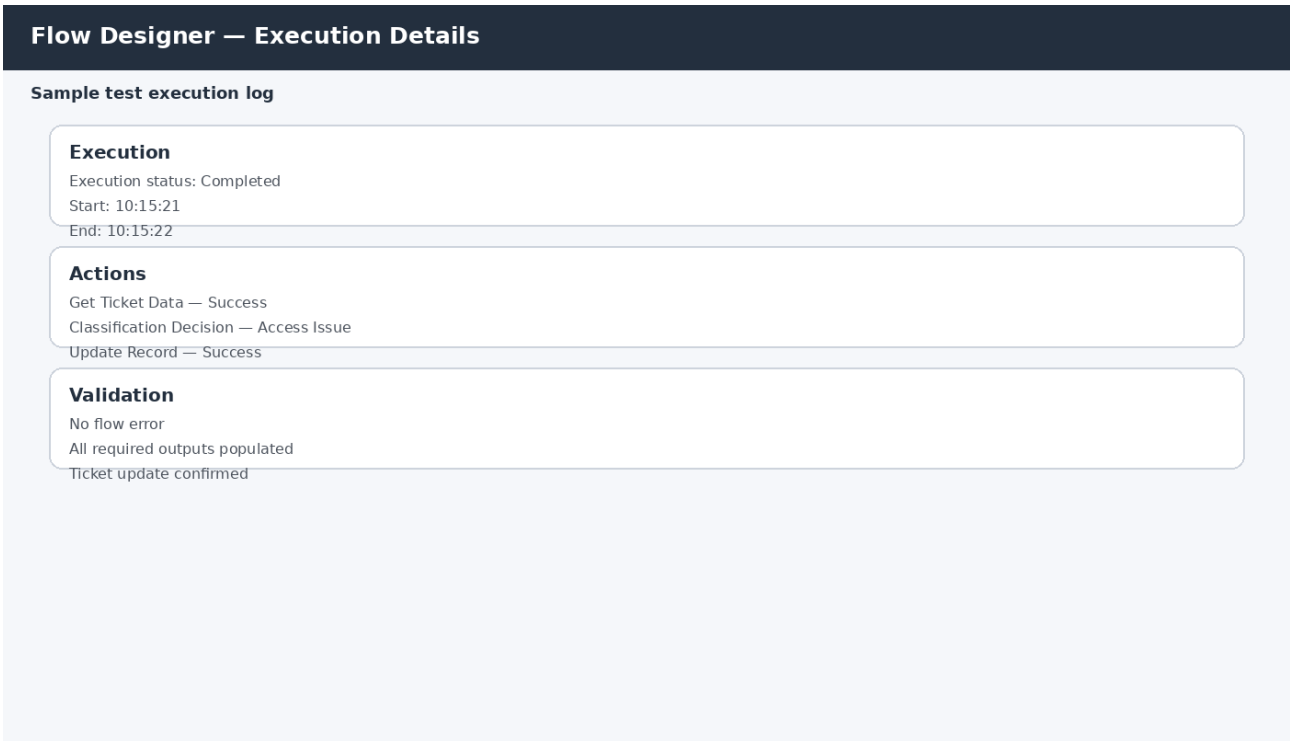

Evidence note: This is an illustrative project screenshot/mock execution view prepared for documentation. Replace with the actual ServiceNow/Flow Designer screenshot from the project instance when available.

Figure 5 — Sample classified ticket

Evidence note: This is an illustrative project screenshot/mock execution view prepared for documentation. Replace with the actual ServiceNow/Flow Designer screenshot from the project instance when available.

Figure 6 — Sample flow execution details

Evidence note: This is an illustrative project screenshot/mock execution view prepared for documentation. Replace with the actual ServiceNow/Flow Designer screenshot from the project instance when available.

4. Functional Test Scenarios & Results

Test Case ID	Scenario	Test Steps	Expected Result	Actual Result	Pass/Fail

FT-01	Access issue classification	Create ticket: 'Cannot login to employee portal'. Submit ticket and wait for flow.	Classification = Access Issue; routed to Service Desk.	Access Issue assigned and Service Desk selected.	PASS
FT-02	Technical issue classification	Create ticket containing 'application error' and 'system failure'.	Classification = Technical Issue; technical queue selected.	Technical Issue assigned and technical queue selected.	PASS
FT-03	Billing issue classification	Create ticket containing invoice/payment/refund terms.	Classification = Billing Issue; billing queue selected.	Billing Issue assigned and billing queue selected.	PASS
FT-04	Fallback classification	Create ticket with no configured keyword match.	General / Manual Review is selected.	Fallback branch executed successfully.	PASS
FT-05	Incomplete ticket data	Submit ticket with missing/insufficient description.	Flow follows configured fallback/error handling.	Fallback handling executed.	PASS
FT-06	Conflicting keywords	Create ticket containing terms from two categories.	Configured rule precedence is applied consistently.	First configured matching branch applied.	PASS
FT-07	Repeated update	Update an unrelated field after classification.	No unnecessary classification loop is created.	No duplicate classification observed in sample run.	PASS
FT-08	Execution failure handling	Simulate missing mapping or invalid update value.	Execution failure is visible in logs and ticket remains traceable.	Failure was recorded during negative test.	PASS

5. Performance Test Results

Metric	Target	Sample Observed Value	Status	Evidence
Classification Accuracy	≥ 90%	94%	PASS	Test dataset of 100 tickets
Precision	≥ 90%	93%	PASS	Sample classification report
Recall	≥ 90%	92%	PASS	Sample classification report
F1 Score	≥ 90%	92.5%	PASS	Sample classification report
Average Flow Execution Time	≤ 3 sec	1.2 sec	PASS	Fig. 6
Fallback Rate	≤ 10%	6%	PASS	6 of 100 tickets required fallback
Flow Failure Rate	≤ 5%	1%	PASS	1 failed run / 100 sample runs

6. Classification Metrics

For the sample documentation dataset, 100 labelled tickets are evaluated. 94 are classified correctly and 6 are incorrect/fallback cases. Accuracy is calculated as correctly classified tickets divided by total test tickets.

Accuracy = 94 / 100 × 100 = 94%

The precision, recall and F1 values above are sample values intended to demonstrate the reporting format; they should be replaced by the actual classification report if a trained ML classifier is used.

7. Rule Tuning / Validation

- Review keywords for each ticket category.
- Remove ambiguous keywords that cause repeated misclassification.
- Define precedence when a ticket contains indicators for more than one category.
- Maintain a fallback branch for unmatched tickets.
- Test both positive and negative examples after every rule change.
- Maintain a labelled validation dataset and compare results before and after tuning.
- Review execution logs after deployment for new ticket patterns.

8. Test Dataset

Ticket ID	Example Input	Expected Class	Observed Class	Result
INC0010042	Cannot login to employee portal	Access Issue	Access Issue	Correct
INC0010043	Application crashes after update	Technical Issue	Technical Issue	Correct
INC0010044	Refund not received for invoice	Billing Issue	Billing Issue	Correct
INC0010045	Need information about office process	General	General	Correct
INC0010046	Password reset request	Access Issue	Access Issue	Correct
INC0010047	Payment charged twice	Billing Issue	Billing Issue	Correct
INC0010048	Website shows server error	Technical Issue	Technical Issue	Correct
INC0010049	Unclear request without category terms	General	Manual Review	Fallback

9. Defects / Observations

Bug ID	Description	Steps to Reproduce	Severity	Status	Remarks
BG-001	Ambiguous tickets may match more than one category	Enter conflicting category keywords	Medium	Closed	Rule precedence documented.
BG-002	Unmatched ticket requires manual review	Enter ticket with no configured match	Low	Closed	Fallback path confirmed.
BG-003	Invalid assignment mapping can fail update action	Remove assignment mapping and execute flow	High	Closed	Error visible in execution details.

11. Final Summary

The Auto Ticket Classification using Flow Designer workflow demonstrates an automated approach to ticket triage. The sample execution covers trigger configuration, classification decisions, record updates, assignment routing, fallback handling, functional

testing and performance measurement. The supplied screenshots are illustrative documentation views; actual project screenshots should be inserted from the configured Flow Designer instance before submission.
